Heuristic Evaluation

Workbook

MAY 2026

Evaluator Name: **Ellen R. De la Cruz**

Project Title: **WonderPets**

Date of Evaluation: May 2,2026

Heuristic	Issue /s	Recommendations
1. Visibility of system status The design should always keep users informed about ongoing activities by giving proper feedback within an appropriate amount of time. Does the design clearly show its current status? or Is feedback given immediately after the user performs an action?	N/A	N/A
4. Match between system and the real world The system should use words and terms that users can easily understand instead of technical terms. Information should also be presented in a clear and logical way based on real-life situations. Will the user understand the terms used in the design? Are the design controls based on familiar real-world conventions?	N/A	N/A
5. User control and freedom Users can make mistakes	Cancel or back options are not easily visible during appointment scheduling.	Make sure back, cancel, and edit buttons are clearly visible during each booking

Heuristic	Issue /s	Recommendations
when using system functions, so the design should provide an easy way to go back or exit. It should also allow undo and redo actions. Does the design allow users to return to the previous step in the process? Are the exit links easy for users to find? Can users easily cancel an action? Is Undo and Redo supported?		step.
6. Consistency and standards Users should not be confused about whether different terms, situations, or actions have the same meaning. Does the design follow industry conventions? Are visual treatments used consistently throughout the design?	Some buttons and layouts vary slightly between pages.	Maintain consistent button colors, spacing, typography, and navigation across all modules.
7. Error prevention A good design should prevent problems from happening instead of only showing error messages. It should avoid situations that may cause errors or provide confirmation before users continue with an action.	Required fields are not clearly marked, so users may accidentally leave important information blank.	Add asterisks (*) for required fields and show real-time validation messages before submission.

Heuristic	Issue /s	Recommendations
Does the design prevent slips by using helpful constraints? Does the design warn users before they perform risky actions?		
8. Recognition rather than recall Reduce the need for users to remember information by making actions, options, and features visible. Instructions should also be easy to see or access whenever needed. Does the design keep important information visible, so that users do not have to memorize it? Does the design offer help in-context?	Users may need to remember previous appointment details while navigating forms.	Display appointment summaries and labels clearly throughout the process.
9. Flexibility and efficiency of use The system should support both new and experienced users by providing shortcuts and allowing them to personalize common actions for faster use. Does the design provide accelerators like keyboard shortcuts and touch gestures?	N/A	N/A

Heuristic	Issue /s	Recommendations
Is content and funtionality personalized or customized for individual users?		
10. Aesthetic and minimalist design A dialogue should avoid irrelevant or rarely needed information because it can distract users and make the important details harder to notice. Is the visual design and content focused on the essentials? Have all distracting, unnecesary elements been removed?	N/A	N/A
11. Help users recognize, diagnose, and recover from errors Error messages should be written in simple language, without codes, clearly explain the problem, and suggest a helpful solution. Does the design use traditional error message visuals, like bold, red text? Does the design offer a solution that solves the error immediately?	Error handling and recovery messages are not clearly visible.	Use clear error messages with suggestions on how users can fix problems immediat
12. Help and	No visible help center, FAQ,	Add FAQs, tooltips, and

Heuristic	Issue /s	Recommendations
documentation A system should ideally work without needing instructions, but if help is needed, it should be easy to search, task-focused, and give simple step-by-step guidance without being too long. Is help documentation easy to search? Is help provided in context right at the moment when the user requires it?	or user guide was shown in the system.	user documentation for easier navigation and support.
